

Instructions for installing our clutch weight. The clutch weight is the same for all bikes with the DDS clutch it is listed to fit. **If attempting to install on a bike not listed for on our site, whether model or year or your country's model, it's up to you to make sure it clears and doesn't rub inside your clutch cover.**

Just lean your bike over a ways, so the oil doesn't come out when you take the clutch cover off. Remove clutch cover- and then remove the bolts holding the assembly together. You can just hold the assembly there as none if it changes.

Go ahead and add the weight to the top of the assembly and tighten it back down.

IMPORTANT: If your clutch weight came with bolts, please use them in place of the stock bolts.

And that's it. You can follow the torque specs in the manual if you'd like. Or just get them nice and tight.

The weight has been tested on all bikes that it's specifically listed for, so **if you hear any rubbing noises or the bike turns over slow, it isn't on right.**
